Midterm Project

Mandy Wang

Home

The overall website design was done to mimic a folder, following a purple color scheme. I got the nav bar at the top to have some similar functionality to folder tabs, through messing with z-indexes and also using clip path to make the li container more trapezoidal

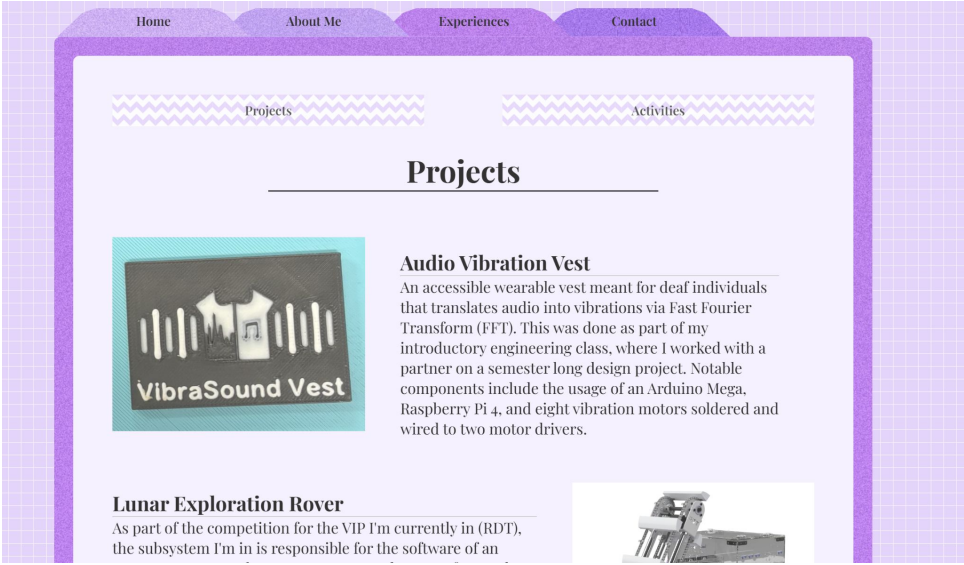
About

Notable features:

- Border outline transformation on the profile picture by manipulating outline offsets

Experiences

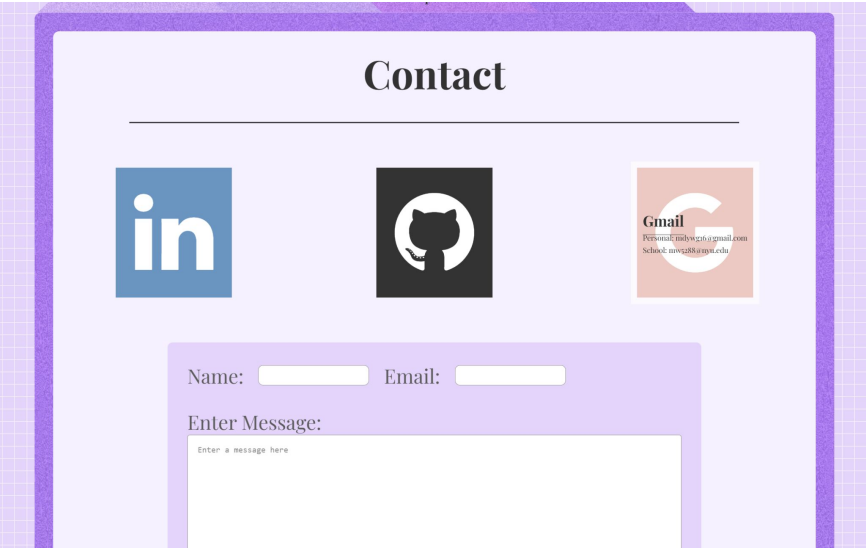
- Flexbox for positioning and organization
- Nav bar at top to jump to project and activities section



Contact

Features:

- A bottom to top reveal transformation done by having a mask overlaid the media icons (from the portfolio lesson)
- CSS formspree contact form



Media Query (Mobile)

- Removed all hover transformation effects
- Switched to flex-direction: column for content
- Adjusted typography and image sizes
- Added horizontal scroll to top nav bar

Code Snippet

For this code snippet, I was trying to have a rounded background image border around my content body to match the folder background. In hindsight, I probably could've added another container and then styled the background separately but my first instinct was to search up CSS border image properties. It turns out that border-image and border-radius conflicted with each other, so I looked up a tutorial online for alternative methods and I ended up coming across this implementation with the ::before pseudoclass.

```
/* portfolio rounded background image border styling */
.content-body {
    margin: 30px 15% 5% 12%;
    padding-bottom: 2rem;
    position: relative;
    background-color: var(--c-b);
    border-radius: 10px;
}

.tab1 {
    --pg-bg: var(--gp-bg);
}
.tab2 {
    --pg-bg: var(--l-bg1);
}
.tab3 {
    --pg-bg: var(--l-bg2);
}
.tab4 {
    --pg-bg: var(--l-bg3);
}

.content-body::before {
    content: "";
    position: absolute;
    top: -30px;
    right: -30px;
    bottom: -30px;
    left: -30px;
    background-image: var(--pg-bg);
    background-repeat: repeat;
    border-radius: 10px;
    z-index: -1;
}
```

Next Steps

- Adding more responsiveness or transform effects (especially to my experience and my home pages)
- More media query support
- Add more content to my experience page
- Add a responsive back to top button
